Course Description

Course description: A self-contained introduction to the theory of soliton equations with an emphasis on their algebraic-geometrical integration theory. Topics include:

1. General features of the soliton systems.
2. Algebraic-geometrical integration theory.
3. Hamiltonian theory of soliton equations.
4. Perturbation theory of soliton equations and its applications to Topological Quantum Field Theories and Sieberg-Witten solutions of N=2 Supersymmetric Gauge Theories

| | |
|---|---|
| Course Prerequisites / Recommendations | Student should be familiar with basic of Hamiltonian mechanics and complex analysis |
|---|---|

| | |
|------------------------------|---|
| Course Academic Level | Master-level course suitable for PhD students |
|------------------------------|---|

| | |
|-------------------------------|---|
| Number of ECTS credits | 6 |
|-------------------------------|---|

| Topic | Summary of Topic | Lectures (# of hours) | Seminars (# of hours) | Labs (# of hours) |
|---|--|-----------------------------|-----------------------------|-------------------------|
| General features of the soliton systems. | Lax representation. Zero-curvature equations. Integrals of motion. Hierarchies of commuting flows. Discrete and finite-dimensional integrable systems. | 4 | 4 | 4 |
| Algebraic - geometrical integration theory. | Spectral transform. Spectral curves. Baker-Akhiezer functions. Theta-functional formulae. | 4 | 4 | 4 |
| Hamiltonian theory of soliton equations. | Universal symplectic form on the spaces of operators. Action-angle variables and the spectral transform. | | | |
| Perturbation theory of soliton equations. | Whitham equations. Generalized hodograph transform. Applications to Topological Quantum field theories, Seiberg-Witten solutions of N=2 SUSY | | | |
